

Control of the motor by the optical flow module

Preview

The motor with optical control uses a flat opaque disk with four blades attached to the rotor. If you're interested in the field of robotics and computer vision systems, you've likely heard of optic flow sensors. But what exactly are they, and how are they used. PMW3901 is an optical flow ASIC that computes the flow internally and provides a difference in pixels between each frame. It uses a tracking sensor that is similar to what you would find in a computer mouse, but adapted to work between 80 mm and infinity. It can be used to determine speed when navigating without GNSS -- in buildings, underground, or in any other GNSS-denied environment.
