## Article Overview

Connecting fiber optic cable to a home involves running the fiber from the provider's network to your property, installing an Optical Network Terminal (ONT), and linking it to your router for high-speed internet.

### Step 1: Check Availability and Plan the Installation

Before installation, confirm that fiber service is available in your area by contacting your internet service provider or checking their website. The provider will assess the neighborhood network and determine the best route for the fiber drop to your home, considering existing infrastructure, utility lines, and terrain .

### Step 2: Bringing Fiber to Your Home

Fiber can be installed using two main methods:

- o Underground Installation: A trench is dug from the street distribution point to your home. A protective conduit is laid, and the fiber cable is pulled or blown through it. Directional boring may be used to minimize disruption when crossing driveways or sensitive landscaping .
- o Aerial Installation: In areas with utility poles, fiber is strung overhead from the nearest pole or junction box to your home. A service drop cable is anchored to the house, usually near the eaves or side wall .

### Step 3: Install the Optical Network Terminal (ONT)

The ONT is a small box installed inside or just outside your home where the fiber enters. It converts light signals from the fiber into electrical signals that your home network can use. The ONT must be connected to a power source and is typically installed by a technician .

### Step 4: Connect the Router

Once the ONT is installed, connect it to your router or gateway using a high-speed Ethernet cable (CAT6 or better). The router distributes the internet signal to your devices via Wi-Fi or additional Ethernet connections. For larger homes, mesh Wi-Fi systems may be added to ensure full coverage .

### Step 5: Testing and Activation

The technician will power on the ONT, test the fiber connection, and activate the service. They will verify speed, signal quality, and Wi-Fi coverage to ensure your home network is fully operational .

## Optional: Fiber Media Converters and Network Expansion

For advanced setups, fiber-to-Ethernet media converters or fiber network adapters can be used to extend the network, connect multiple devices, or provide electrical isolation for outdoor equipment like cameras or access points . This is particularly useful for connecting fiber directly to desktops or servers without converting to copper Ethernet. By following these steps, your home can achieve a high-speed, low-latency fiber optic internet connection that is more reliable and faster than traditional copper-based networks .
